

TEAM

- **PROJECT: BAYORA**
- **TEAM NAME & MEMBERS: TO BE ADDED**
- **ROLES: TO BE ASSIGNED**

PROBLEM STATEMENT & THEME

WHY IT MATTERS

- Problem - AI security testing needs a repeatable, authorized workflow.
- Impact - Prompt injection and unsafe behavior can expose data and erode trust (OWASP, 2025).
- Theme alignment - Secure, responsible AI; official HIH theme requires confirmation.

SOLUTION

- Overview - A proposed platform for authorized AI security assessments.
- Features - Red/Blue workflows; evidence-backed findings; traceable review.
- Value - One workflow from adversarial test to evidence, decision, and audit.

ARCHITECTURE

- Stack - Browser UI; Python API; SQLite; isolated workers; provider adapters.
- Flow - User -> scope/policy checks -> adversarial tests -> evidence -> findings/audit.
- APIs - Planned model/provider APIs; optional TinyFish research integration.

MARKET RESEARCH/ANALYSIS

- Users - AI builders, security researchers, enterprise AI/security teams.
- Market - AI governance: $308.3M (2025), 36% CAGR forecast (GVR, 2026); proxy category, not Bayora TAM.
- Revenue - Community edition -> paid team/enterprise plans; assessment services.
- Growth - Regulation, AI adoption, and demand for traceable oversight.

FUTURE SCOPE

- MVP - Repeatable authorized tests + evidence trail.
- Next - More providers, threat mappings, and report formats.
- Enterprise - Identity, integrations, collaboration, and controls.
- Long term - Benchmark libraries and scalable global use.

EXTRA(OPTIONAL)

SAFEGUARDS & CREDIBILITY

- Authorized scope + approved public-source allowlist
- RBAC + tenant isolation + tamper-evident audit
- Untrusted content stays separate; evidence is marked unverified
